

The last piece of the puzzle is the `submit` function:

```
methods: {  
  submit() {  
    if (this.model.subscriber) {  
      this.$inertia.put(  
        '/subscribers/${this.model.subscriber.id}',  
        this.form  
      )  
    } else {  
      this.$inertia.post('/subscribers', this.form)  
    }  
  },  
}
```

If there's a subscriber, it will call the PUT endpoint (the `update` method in the controller); otherwise, it calls the POST endpoint (the `store` method in the controller). The `this.$inertia.post` is very similar to `await axios.post` but it will do a page reload after getting the response. This is why it's synchronous. And it's perfect for the use case because after submitting the subscriber, I want to redirect the user back to the index page. You can see this in the controller:
