

```
namespace Domain\Subscriber\DataTransferObjects;

use Spatie\LaravelData\Data;

class FormData extends Data
{
    public function __construct(
        public readonly ?int $id,
        public readonly string $title,
        public readonly string $content,
    ) {}
}
```

It only has a title and content property (the HTML of the form itself). The `TagData` is even more simple:

```
namespace Domain\Subscriber\DataTransferObjects;

use Spatie\LaravelData\Data;

class TagData extends Data
{
    public function __construct(
        public readonly ?int $id,
        public readonly string $title,
    ) {}
}
```
