

```

enum OrderStatuses: string
{
    case Draft = 'draft';
    case Pending = 'pending';
    case Paid = 'paid';
    case PaymentFailed = 'payment-failed';

    public function createOrderStatus(Order $order): OrderStatus
    {
        return match($this) {
            OrderStatuses::Draft => new DraftOrderStatus($order),
            OrderStatuses::Pending => new PendingOrderStatus($order),
            OrderStatuses::Paid => new PaidOrderStatus($order),
            OrderStatuses::PaymentFailed => new
PaymentFailedOrderStatus($order),
        };
    }
}

```

As you can see, this enum acts like a factory function. This is one of the hidden features of PHP8.1 enums. In the Order model, we can leverage this with an attribute accessor:
