```php
namespace Domain\Shared\Models\Scopes;

use Illuminate\Database\Eloquent\Builder;
use Illuminate\Database\Eloquent\Model;
use Illuminate\Database\Eloquent\Scope;

class UserScope implements Scope
{
  public function apply(Builder $builder, Model $model)
  {
    if ($user = request()->user()) {
      $builder->whereBelongsTo($user);
    }
  }
}
```

It retrieves the currently logged-in user from the request and adds a where condition to the query. It's being used in a trait called `HasUser` :

```php
namespace Domain\Shared\Models\Concerns;

use Domain\Shared\Models\Scopes\UserScope;
use Domain\Shared\Models\User;
use Illuminate\Database\Eloquent\Relations\BelongsTo;

trait HasUser
{
  public function user(): BelongsTo
  {
```
