```php
use Illuminate\Http\RedirectResponse;

public function store(
    SubscriberData $data,
    Request $request
): RedirectResponse {
    UpsertSubscriberAction::execute($data, $request->user());

    return Redirect::route('subscribers.index');
}
```

It returns a `RedirectResponse` with the `susbcribers.index` route, the subscriber list.

I highly recommend you to go through the last few chapters one more time because it'll be a recurring theme of this book, so it's essential to understand how DTOs and view models work.
