The main benefit is that if you work on a broadcast-related feature, you go into the Broadcast folder, and everything is there. Meanwhile, your co-worker can work in the Subscriber domain. It also makes onboarding easier, in my opinion.

As you can see, there is no HTTP or Controllers folder inside a Domain. That's intentional. A domain contains only business code. The subscriber folder contains everything you can do with a subscriber. It does not have any application-related code. By application, I mean:

- API
- Web app
- Console commands

These environment-related classes live inside the app folder, just like in any Laravel app.
