Shared domain

Now you probably have a better idea about the Shared domain. It contains classes that are shared across many (often every) domains. So far, we have put the `User` and the `BaseModel` classes inside the Shared domain. What other classes will it contain?

- Any base class like the `BaseModel`. For example, view models will have a parent class that lives inside the Shared domain (more on that later).
- General-purpose classes, such as a `Percentage` value object, a `DateFilter`, an Eloquent trait.
- Or even some actions can be placed inside this domain. For example, you need to read a CSV file and write an action for this. What if you need to use this class from many domains?

Users

I want to clarify one more thing before moving on. There are no teams, companies, or tenants in this application. Users register and can create their subscribers, broadcasts, automations, etc. So (almost) every table has a `user_id` column.
