I set everything to null, and in the `created` hook, I initialize these properties:

```
created() {
  if (!this.model.subscriber) {
    return;
  }

  this.form = {
    id: this.model.subscriber.id,
    first_name: this.model.subscriber.first_name,
    last_name: this.model.subscriber.last_name,
    email: this.model.subscriber.email,
    form_id: this.model.subscriber.form.id,
    tag_ids: this.model.subscriber.tags.map(t ⇒ t.id),
  };
}
```

I do this in the `created` method because the `model.subscriber` can be null, so, unfortunately, it won't work in the `data`.

I use the `form` object for data bindings:

```
<div>
  <label for="first_name">
    First Name
  </label>
  <input v-model="form.first_name" id="first_name" type="text"
placeholder="Jane">
</div>
```
