Vue Component

This book is about backend, but I'll also show you some Vue examples. So let's see how the component handles the view model.

First, it accepts it as a prop:

```javascript
export default {
  props: {
    model: {
      type: Object,
      required: true,
    },
  },
}
```

Then I define a `form` key in the data object:

```javascript
data() {
  return {
    form: {
      id: null,
      first_name: null,
      last_name: null,
      email: null,
      form_id: null,
      tag_ids: [],
    }
  };
}
```
