```php
class Margin
{
  public function __construct(
    public readonly Millions $topLine,
    public readonly Millions $bottomLine,
    public readonly Percent $margin,
  ) {}
}
```

And we can use the `Margin` class like this:

```php
class MetricsService
{
  public function profitMargin(IncomeStatement $incomeStatement): Margin
  {
    return new Margin(
      topLine: $incomeStatement->revenue,
      bottomLine: $incomeStatement->net_profit,
      margin: new Percent(
        $incomeStatement->net_profit->value /
$incomeStatement->revenue->value
      ),
    );
  }
}
```
